The invention describes a method of protecting a poikilothermic fish against infection by the bacterial pathogen Piscirickettsia Salmonis comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of bacterial strain Piscirickettsial salmonis as a vaccine to induce immunity in fin-fish against Rickettsial septicaemia and other related Rickettsial diseases caused by either a virus, bacteria or parasite. This is the amino acid sequence of the Escherichia coli codon optimised outer surface lipoprotein OspA (17e2) used in the creation of the vaccine described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LGGLIGSKIGQSMDQQDKIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQE 120

                                                                                                                                                                                                                                                           This invention relates to a method for the protection against infection of a poixilothermic fish by the bacterial pathogen, Piscirickettsia asalmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed 05pA, or an immunogenic fragment of ospA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonis rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents optimised P. salmonis OspA protein 17E2. The DNA encoding OspA 17E2 (AAF86247) has been optimised for expression in Ecsherichia coli. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antibody response.

The invention describes a method of protecting a poikilothermic fish against infection by the bacterial pathogen Piscirickettsia Salmonis comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of bacterial strain Piscirickettsia salmonis as a vaccine to induce immunity in fin-fish against Rickettsial septicaemia and other related rickettsial diseases caused by either a virus, bacteria or parasite. This is the amino acid sequence of the Escherichia coli codon optimised outer surface lipoprotein OspA (17e2) with an N-terminal fusion used in the creation of the vaccine described in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a method for the protection against infection of a poixllothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed 05pA, or an immunogenic fragment of 0spA in the form of a vaccine. The method is used for protecting animals, particularly poixliothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents the amino acid sequence of C17E2, a P. salmonis OspA construct optimised for expression in Escherichia coli, fused to an undefined N-terminal fusion partner. The fusion protein is used in a vaccine to create an anti-OspA antibody response.

This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a p. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA, in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen ic salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents p. salmonis OspA protein. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GGLIGSKIGQSMDQQDKIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQER 121

modulating biofilm formation by bacteria. The method of the invention is useful for identifying a compound capable of modulating biofilm formation by bacteria or modulating bacterial antibiotic resistance. The method of the invention is also useful for diagnosing and treating a subject (especially an immunocompromised human) that is afflicted with a biofilm-associated disease or disorder, such as: cystic fibrosis; AIDS; middle ear infections; and medical device-associated infections; and medical device-associated infections. The present amino acid sequence represents a protein that is used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10 ÓJAGTÁJGÁVÝGGLLÁNQIGGGTGKKIATVAGÁVGGGYAGNKVQEGMQERDTYTTTETRC 129

                                                                                                                                                                                                                                                                                                                        against infection by the bacterial pathogen Piscirickettsia Salmonis comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of bacterial strain Piscirickettsia salmonis as a vaccine to induce immunity

This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents an immunogenic epitope of the P. salmonis OspA protein. The peptide is used to raise rabbit anti-OspA antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of protecting a poikilothermic fish against infection by the bacterial pathogen Piscirickettsia Salmonis comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inducing immunity in fin fish to Rickettsial septicaemia, comprises administration of an outer surface lipoprotein (OspA) of a bacterial strain, as a vaccine -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Outer surface lipoprotein, OspA, antibacterial, immunosupressive, vaccine; poikilothermic fish, fin-fish, Rickettsial septicaemia;
 vaccine containing the OspA protein of Piscirickettsia salmonis
                                                                                                                                                                                                                                                                                                     13.5%; Score 112; DB 22; Length 20; 100.0%; Pred.    to induce immunity
bacterial strain Piscirickettsia salmonis as a vaccine to induce immun:
in fin-fish against Rickettsial septicaemia and other related
Rickettsial diseases caused by either a virus, bacteria or parasite.
This sequence represents a synthetic peptide used to create polyclonal rabbit antibodies against the Piscirickettsia salmonis outer surface

                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                    .,
                                                                                                       The present invention provides the protein and coding sequences of proteins from Moraxella catarrhalis. These can be used to produce vaccines which protect against M. catarrhalis infection, which can cause otitis media, respiratory infection, sinusitus, and pneumonia. The present sequence is a protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of BASB113 protein from Moraxella catarrhalis strain Mc2931 (ATCC 43617), a causative agent of otitis media in children and pneumonia in adulte. The invention provides BASB113 polypeptides, and polymucleotides encoding them, as well as expression vectors, host cells and methods for producing BASB113 polypeptides using recombinant methods. Also claimed is a vaccine composition comprising a BASB113 polypeptide, an immunogenic fragment of a BASB113 polypeptide, or a polypeptide having at least 85% amino acid sequence identity to BASB113, or comprising a
         Moraxella polypeptide and polynucleotides useful as vaccine for immunizing a host e.g. humans against disease e.g. otitis media, pneumonia, caused by infection of the bacteria

The invention is useful in a method of treatment of the human or animal body. The invention is also useful for protecting an individual against a bacterial infection. The invention has improved outer-membrane vesicle-shedding properties. Blebs are more easily made in higher yield from the invention, and are more homogeneous in nature and can be more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel hyperblebbing Gram-negative bacterium that has been genetically modified by down-regulating expression of Tol genes, and/or attenuating peptidoglycan-binding activity useful for treating bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               peptidoglycan-binding; peptidoglycan-associated site; outer-membrane; bacterial infection; vesicle-shedding; Bleb; filter sterilised; detergent; deoxycholate; homogeneity; antibacterial; vaccine; roll; roll; ompCD; xompD, PAL-1; PAL-2.

polynucleotide encoding such a polypeptide. A claimed method of diagnosing a Moraxella infection involves identifying a BASB113 polypeptide or antibody. A claimed therapeutic composition useful in treating humans with M. catarrhalis infection comprises at least 1 antibody directed against a BASB113 polypeptide. BASB113 polypeptides also have utility in raising specific antibodies, and in screening for antibacterial drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hyperblebbing; Gram-negative bacterium; genetically modified; Tol

activity with a vaccine mechanism of action. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease that the property of the propert

                                                                                                                                                                                                                        ņ
                            the use of detergents such as deoxycholate, thus obviating chromatography purification and ultra centrifugation steps. Vesicles prepared from the invention have reduced particle size (allowing sterile filtration through 0.22 mum pores), increased batch homogeneity, and a superior yield. The present amino acid sequence represents a Moraxella catarrhalis protein, as described in the invention.
                                                                                                                                                                                                                                                          28

```

```
cc activity with a vaccine mechanism of action. The PG polypeptides have antibacterial cc activity with a vaccine mechanism of action. The PG polypeptides can be cc used as vaccines especially against Porphorymonas gingivalis. Probes can cc be used to detect Porphorymonas gingivalis in standard hybridisation cc assays. Porphorymonas gingivalis is involved in periodontal disease cc especially gingivitis.

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION NUMBER: US/09/252,991A
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-01-18
PRIOR FILING DATE: 1998-07-27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                80 QIAGTAIGAVVGGLLGNQIGGGTGKKIATVAGAVGGGYAGNKVQEGMQERDTYTTTETRC 139

Sequence 8009, Application US/09328352

Patent No. 6562958

GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: BUJMANNII FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: BUJMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 8009
LENGTH: 126

Patent No. 6562958

GENERAL INFORMATION:
PAPLICANT: GARY L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT APPLICATION NUMBER: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 14

Ratent No. 6562958
GENERAL INFORMATION:
FAPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
TITLE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 4253
LENGTH: 258
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                APPLICANT: Lynn A Doucette-Stamm and David Bush

Sequence 6750, Application US/09328352
Patent No. 6562958
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT PILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
LENGTH: 215
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7;

Sequence 1381, Application US/09925300

Patent No. US20020151681A1

GENERAL INFORMATION:

APPLICANT: Craig Rosen,

APPLICANT: Steve Ruben,

TITLE OF INVENTION: Nucleic Acids, Proteins and Antibodies

FILE REFERENCE: PAIO1.

CURRENT APPLICATION NUMBER: US/09/925,300

CURRENT FILING DATE: 2001-08-10

PRIOR APPLICATION NUMBER: PCT/US00/05988

PRIOR PILING DATE: 2000-03-08

PRIOR FILING DATE: 1999-03-12

PRIOR FILING DATE: 1999-03-12

NUMBER OF SEQ ID NOS: 1890

SOFTWARE: PATENTIN VET: 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 71;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Indels

rickettsial common antigen precursor - Rickettsia prowazekii
NyAlternate names: 17kD surface antigen; outer membrane protein (omp); RP833
C;Species: Rickettelala prowazekii
C;Date: 16-Mar-1990 #text\_change 03-Nov-2000
C;Accession: D33971; B71645
R;Anderson, B.E; Tzianabos, T.
R,Anderson, B.E; Tzianabos, T.
Bacteriol. 171, 5199-5201, 1389
A;Fitle: Comparative sequence analysis of a genus-common rickettsial antigen gene.
A;Reference number: A33971; MUID:89359171; PMID:2768201

A; Accession: D33971

A;Status: preliminary A;Molecule type: DNA A;Residues: 1-159 <AND>

A;Cross-references: GB:M28482; NID:g152461
A;Note: the sequence in GenBank entry RIRANT17KC, release 109.0, (PID:g152462) omits the A;Note: the sequence in GenBank entry RIRANT17KC, release 109.0, (PID:g152462) omits the Nature 396, 133-140, 1998
A;Title: The genome sequence of Rickettsia prowazekii and the origin of mitochondria. A;Reference number: A71630; MUID:99039499; PMID:9823893

A; Accession: B71645

A;Status: nucleic acid sequence not shown; translation not shown A;Molecule type: DNA

C; Superfamily: rickettsial common antigen C; Keywords: surface antigen A; Gene: omp; RP833
